

Product Description

Product Name: CT26.WT-iRFP-Neo
Catalog Number: CL091
Lot Number: CL-IM197

Species: Mouse (*Mus musculus*)
Strain: BALB/c
Cell type: Colorectal carcinoma
Parental cells: CT26.WT (ATCC® CRL-2638™)
Morphology: Epithelial
Growth mode: Adherent
Reporter gene: Near infrared fluorescent protein (iRFP)
Selection gene: Neomycin (Neo)

This is a polyclonal population derived from the murine colorectal carcinoma CT26.WT cell line (ATCC® CRL-2638™). Parental CT26.WT cells were transduced with LV-iRFP-P2A-Neo (Imanis #LV033) encoding the near infrared fluorescent protein (iRFP; ex/em = 690/710 nm) cDNA under the spleen focus-forming virus (SFFV) promoter linked to the neomycin resistance gene (Neo) via a P2A cleavage peptide. High iRFP expressing cells were selected using G418. The lentiviral vectors are self-inactivating (SIN) vectors in which the viral enhancer and promoter have been deleted. Transcription inactivation of the LTR in the SIN provirus increases biosafety by preventing mobilization by replication competent viruses and enables regulated expression of the genes from the internal promoters without *cis*-acting effects of the LTR¹.

Mycoplasma Testing

The CT26.WT-iRFP-Neo cell line has been tested for mycoplasma contamination and is certified mycoplasma free.

Cell Line Authentication

The parental CT26.WT cell line was authenticated and certified free of interspecies cross contamination by STR profiling with 27 STR loci.

Recommended Uses

CT26.WT-iRFP-Neo cells are suitable for *in vitro* and *in vivo* experimentation.

The iRFP transgene in the CT26.WT-iRFP-Neo cells facilitates *in vivo* noninvasive imaging of implanted cells.

Storage Instructions

Remove cells from the dry ice packaging and immediately store in the vapor phase above liquid nitrogen (below -130°C).

Complete Growth Medium

Dulbecco's Modified Eagle's Medium (DMEM)
10% fetal bovine serum (FBS)
1% Penicillin/Streptomycin
0.4 mg/mL G418 (to maintain high iRFP expression)

G418 should NOT be added to the medium until a culture has been well established from the thawed cells (about 1 week). It is also recommended that a backup frozen cell stock be generated (see below) before adding G418 to the growth medium.

Thawing Instructions

1. Thaw cells by gently swirling in a 37°C water bath. To limit contamination, do not submerge the O-ring and cap.
2. When cells are ~70% thawed (less than 1 min), remove the vial and wipe down with 70% ethanol. Allow tube to dry completely.
3. In a biosafety cabinet, transfer the cells into a 15 mL conical tube containing 5 mL of pre-warmed complete growth medium without G418. Centrifuge cells at ~250 x *g* for 3-5 min.
4. Remove supernatant and resuspend cells in 1 mL complete growth medium without G418. Transfer cells to a T75 flask containing 10 mL pre-warmed complete growth medium without G418.
5. Incubate the culture at 37°C with 5% CO₂. After 48 hours, replace the culture supernatant with complete growth medium containing 0.4 mg/mL G418. Cells should reach full confluency 3-4 days after thawing.

Subculturing Instructions

Volumes are given for a T75 flask. Increase or decrease as needed. In order to maintain high iRFP expression, it is recommended that cells be subcultured in the presence of 0.4 mg/mL G418. CT26.WT-iRFP-Neo cells do not form a 100% confluent monolayer. It is recommended that cells be passaged when they reach ~80% confluency.

1. Remove culture medium from cells.
2. Carefully wash the cell monolayer with 5-10 mL of phosphate buffered saline.
3. Add 2 mL of 0.25% Trypsin-EDTA solution to the flask and incubate at 37°C until cells have dissociated (approx. 1-2 min).
4. Neutralize the trypsin by adding 8 mL complete growth medium, and mix by gently pipetting up and down.
5. Transfer desired portion of the cells to a fresh T75 flask. Add fresh complete growth medium to a total volume of 10 mL and return cells to 37°C/5% CO₂ incubator.

For maintenance a subcultivation ratio of 1:10 is recommended. At this ratio cells will be ready for passage every 3-4 days.

Freezing Medium

CT26.WT-iRFP-Neo cells can be amplified and used to generate additional frozen stocks. Frozen stocks should be preserved in a designated cryopreservation medium or in complete growth medium without G418 supplemented with 5-10% DMSO.

Additional Considerations

CT26.WT cells easily detach from tissue culture surfaces. Coating culture plates with poly-D-Lysine prior to use can be used to increase cell adherence to the plates if necessary.

Certificate of Analysis

Testing performed by Imanis Life Sciences

Test description	Result
Post thaw viable cell recovery	97%
Cells/vial	~ 5 x 10 ⁶
Sterility	No contamination detected
Mycoplasma	No contamination detected
Neomycin selection	Pass QC
Fluorescence expression	Pass QC
Average Doubling Time	14.5 hours*

*Doubling time represents the average doubling time during logarithmic growth. This value should be used for general estimation only.

Morphology:

Photos taken at 100X magnification.

Fluorescence Expression

CT26.WT-iRFP-Neo cells (red) or isotype control (CT26.WT parental; grey) cells were fixed with paraformaldehyde and analyzed by flow cytometry (20,000 events).
